The secure and durable RFID card

The RFID card enables comfortable, contactless access. But it also combines sustainability, security and versatility. Reusable, encrypted and suitable for storing a variety of applications, the keycard also provides advertising space as an additional source of income.

Reusable

By deleting the access authorizations and simply reprinting the thermal print area, the keycards can be used multiple times over the long term. Likewise, you can offer your guests the option to reload the card time and time again using the DTA number (Direct to Access) in the webshop.

Effective protection, high security

SKIDATA's highly effective security mechanisms and encryption algorithms ensure reliable protection of the RFID card. These measures prevent the manipulation or cloning of saved authorizations, credits (point and time cards, payment systems, locking authorizations) as well as personal data.

Comfort for you and your customers

With just a single card, give your guests access to the ski slope, spa, car park, hotel and more. The RFID card is read without contact so it can conveniently remain in a pocket or wallet. This makes it much easier for your guests – for example, when carrying their ski equipment – and lets them pass through the ticket control both comfortably and quickly.

Customized design and printing

The RFID card is perfectly matched to SKIDATA systems, but its design is completely in your hands. You can use the free space on the card for your own advertising purposes or you can sell it to sponsors and partners. The rewritable print area is also ideal for displaying additional information.
