'Zigzag' your way straight to attractive benefits

SKIDATA's single-use tickets with RFID technology give your guests comfortable, contactless access. Thanks to the fanfold ('zigzag' or 'accordion' style) format, you and your staff benefit from reliable ticket separation as well as reduced effort due to the compact storage of large quantities of tickets.

Runs like a clockwork

The fanfolding technique is optimized for providing reliable ticket separation and therefore greatly reducing incidents during the ticketing process. This, together with its large ticket quantity of up to 2500 tickets per package unit (H70) and intake line, reduces the service and maintenance intervals.

Effective protection, high security

The security of the tickets – which can be used for a wide variety of access authorizations – is provided by SKIDATA through on- and offline security mechanisms and encryption algorithms. These protect credit balances (points and time cards, payment systems, locking authorizations) to an high extend from manipulation.

Hands-free on your way with RFID

Simply insert your ticket in your pocket and have both hands free to comfortably pass through the ticket control: With keytix flow, your guests enjoy contactless access. This shortens waiting times and increases throughput. Benefits that both you and your guests can enjoy.

Ticket and advertising space in one

Turn your tickets into advertising space and an additional source of income. You can sell the extra printable area on the ticket to sponsors and partners, or use it for your own purposes. Editing the design in your company colors gives the tickets a very personalized touch.
