

Keep your business up to date and secure

Safe and flexible automatic update of software infrastructure with “Automatic Software Deployment”

Parking systems have to work securely and be stable and up to date, otherwise parking guests cannot enter and leave, and downtimes may cause loss of revenue. With the new Parking.Logic v14, the software infrastructure is updated automatically for maximum safety in operation.

- Increased system availability due to automated software distribution during normal operation times
- Flexibility in configuration and customization
- High threat protection due to secure download of software from the SKIDATA sweb portal

Time & Cost Saving

Flexible

Secure

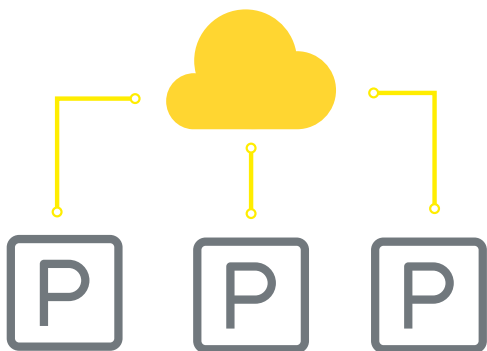

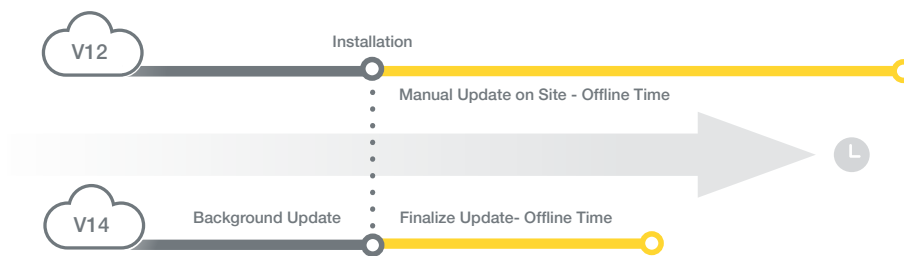

Your parking is always up to date

Optimized software maintenance by automated check, download and installation of software.

Increased system availability saves time and maximizes profit

Small cyclic updates can be easily integrated into the processes of daily business. The system can be configured to download and optionally install service-pack and hotfix software packages in the background. Manual planning and coordination of service slots are reduced significantly. That means a high system availability and less downtime, of up to 50%.

Your benefit: Up to 50 % less downtime

Safety and flexibility

The local parking facilities can be connected to SKIDATA's hosted swweb Portal. The download of quality-controlled software from a secured source is performed automatically. Time, type and degree of automation can be configured and customized.

This enables the car park operator to decide if, how and when the software deployment and installation shall be carried out and he or she can tailor the software maintenance perfectly to the daily operation. The car park operator maintains full control over the software update function.

Your benefit: Customized and secure software updates

Maximum protection

"Automatic Software Deployment" combined with "Microsoft Automatic Updates" and SKIDATA's managed virus protection "Protect.Care" are the three pillars to keep your local parking infrastructure secure. This offers a powerful, centrally managed security umbrella to protect the car park's software infrastructure.

Your benefit: Fully managed protection of software infrastructure
